

Reducer scheduling: direct numerical evidence

Full runs: 1,430,848 checked samples per version; 7 geometries; 43,758 production allocations.

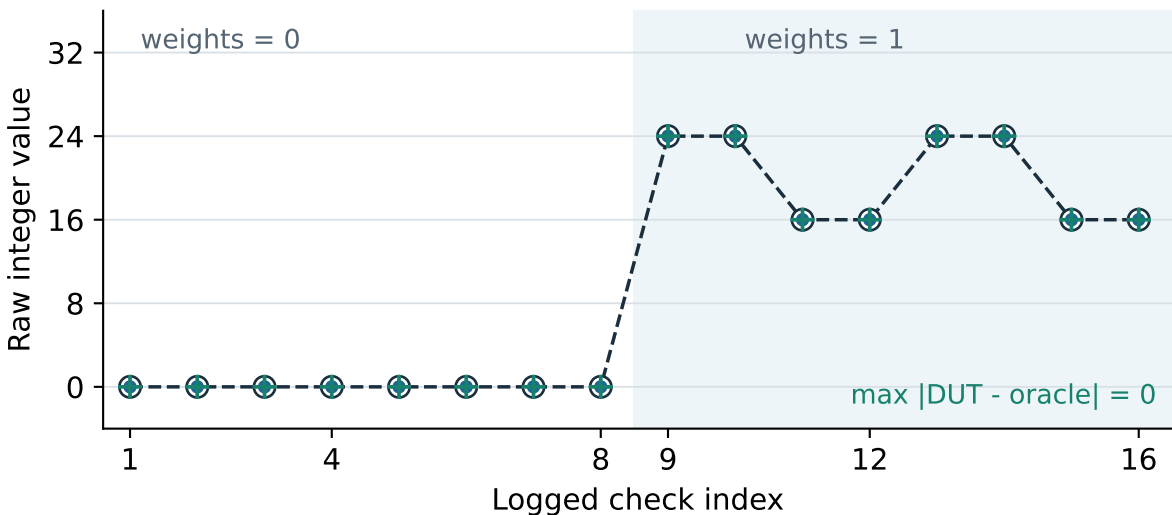

First 16 logged cases below: 32 slices / 8 active / 3 cells per slice. The two DUT traces and oracle coincide.

-○- Scalar oracle • DUT: 5.020 + DUT: 5.49

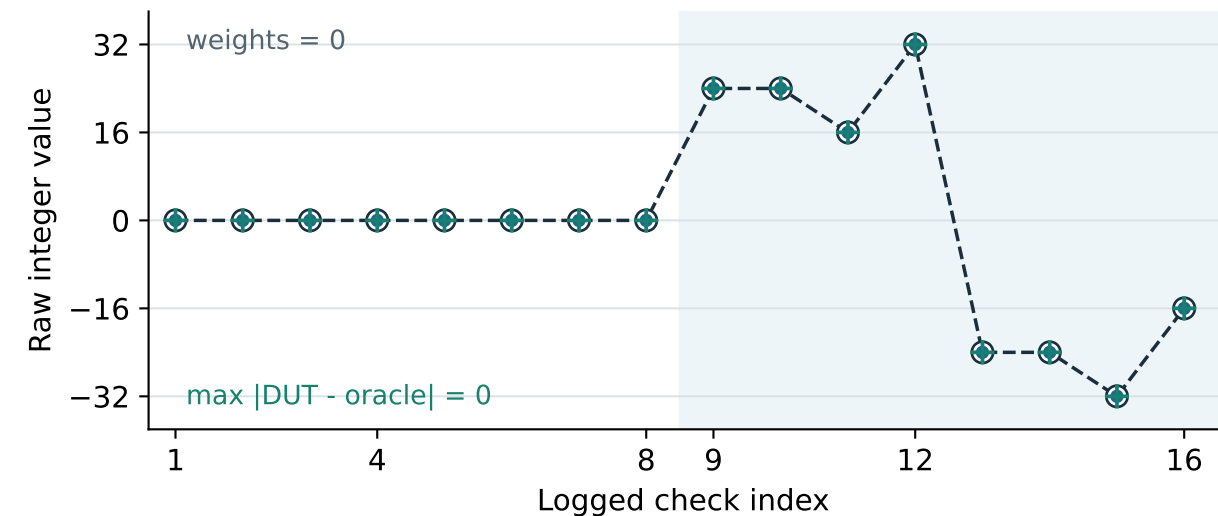

T: total weight sum

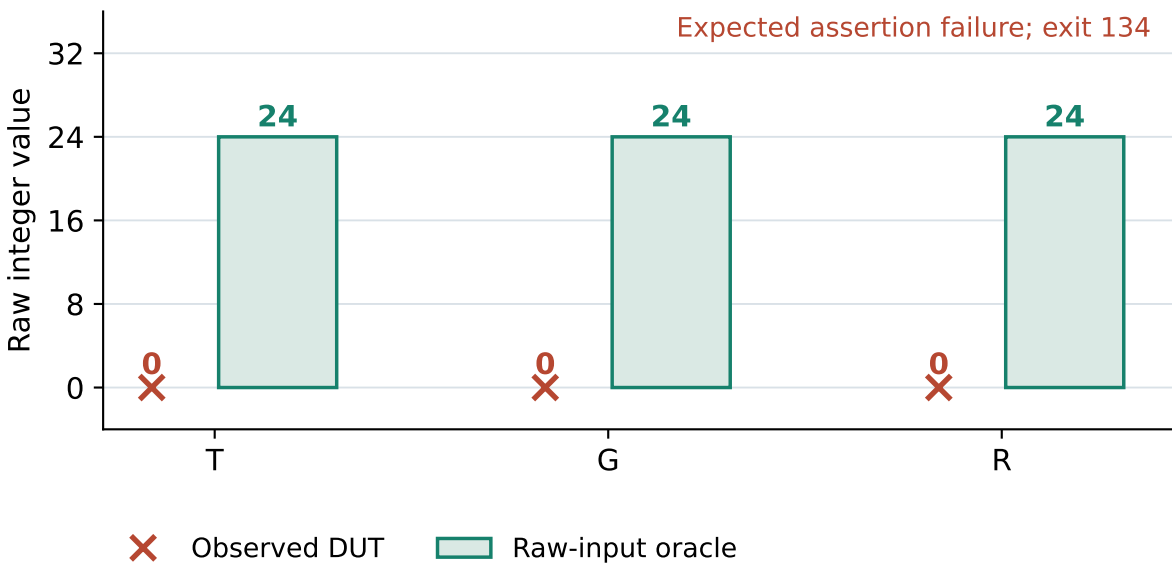

G: sampled weight sum

R: signed rail correction

Shared-input negative control: check 9

The mutation forces the shared weight snapshot to zero; the oracle still reads the original stimulus.

Source: archived run logs, not an analog waveform or STA result. R is decoded as signed 66-bit; C++ padding is discarded.
